04

BACKGROUND

47% of the total patients dataset suffer from Chronic Kidney Disease (CKD) or suffered from Acute Kidney Failure.

Target Population

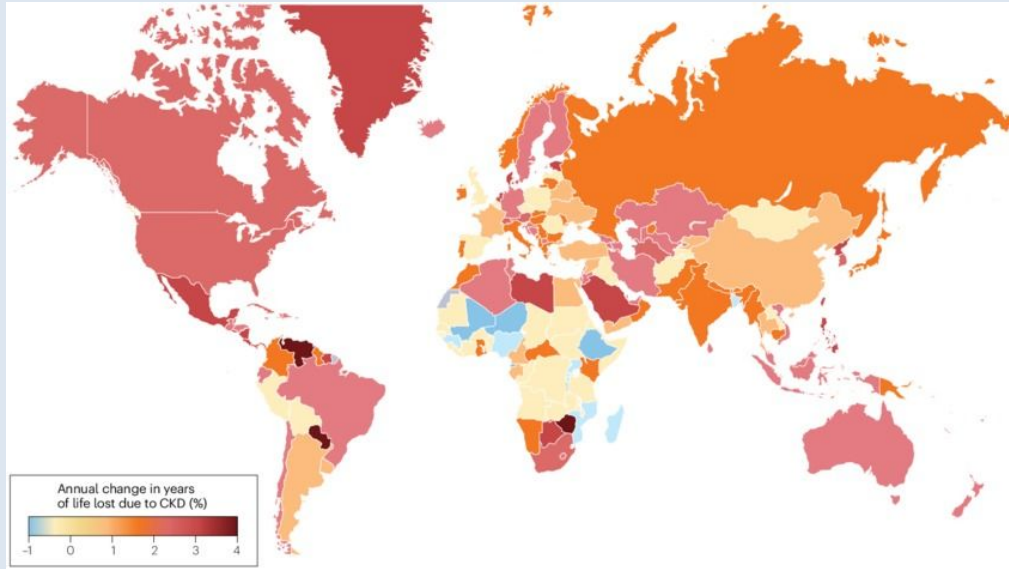

Patients who received one diagnosis related to kidney diseases

Result Variable

Did the patient die during its ICU stay or not ?

Annual death due to CKD - Global

Around 15% of U.S. adults, or approximately 37 million people, have CKD

High-Risk Groups in US:

African Americans

Hispanics

Native Americans

Asian Americans

Statistic Highlights

10% of global population have CKD

38% of adults aged 65+ have CKD

US: 29% of patients with ESRD* live with kidney transplant

*ESRD: end-stage renal disease

RESEARCH QUESTION

How do demographic factors, secondary diagnoses and test results predict mortality during ICU stay in patients with kidney disease ?

PREDICTORS

DEMOGRAPHIC

- Gender
- Age
- Insurance status
- Ethnicity

DIAGNOSIS

- Diabetes mellitus or type II
- Urinary infection
- Depressive disorder

LAB & TEST RESULTS

- Creatinine
- Blood Urea Nitrogen (BUN)
- Heart Rate

PREPROCESSING

01

Tables

Combining the various tables from MIMIC III

02

Predictors

Keeping demographic columns and creating new binary columns for relevant chosen diagnosis

03

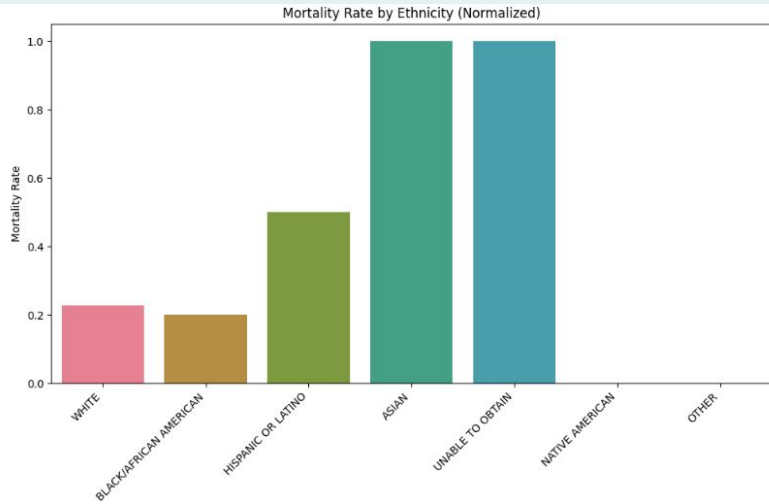

Multiple tests

Creating new columns for test predictors: first entry, max & mean

04

Missing Values

Filling missing and problematic values

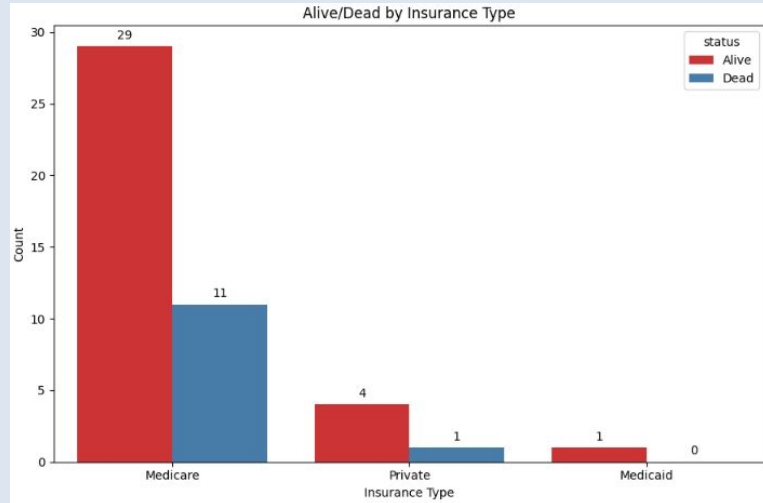

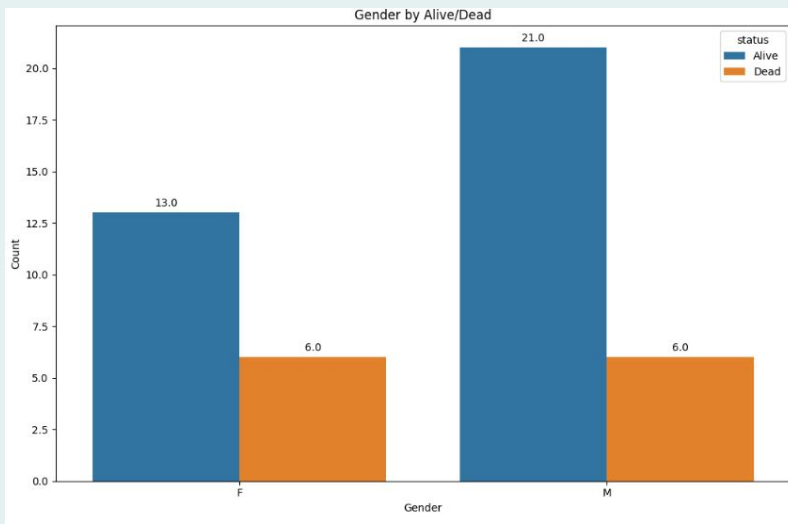

Mortality Rate by Ethnicity

Mortality by Insurance Type

Total Medicare spending on CKD was \$75 billion in 2020

Mortality by Gender

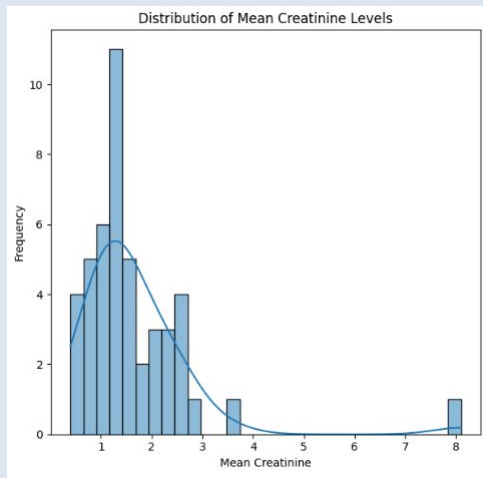

- 31.5% of female died
- 22% of men died

Age Distribution in the target population

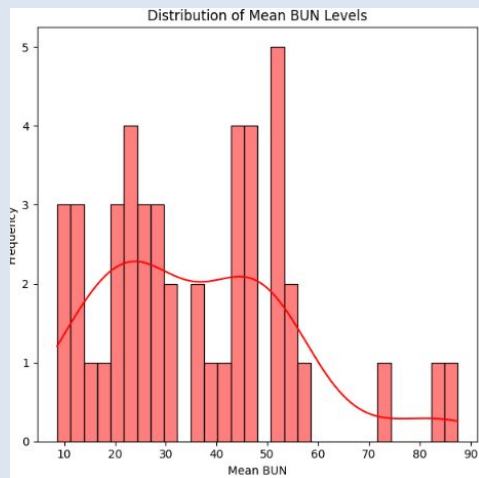

Majority 60+

+

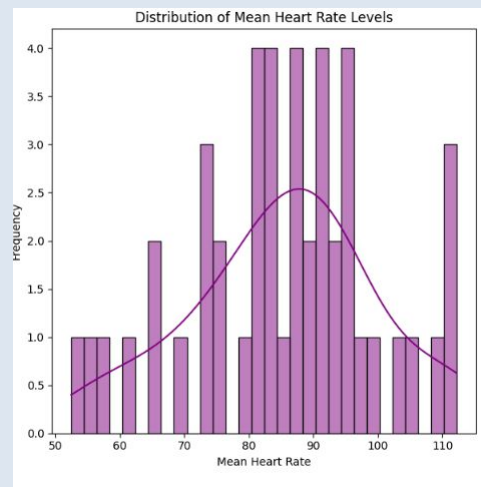

Normal Range of Creatinine:
0.7 to 1.3 mg/dL

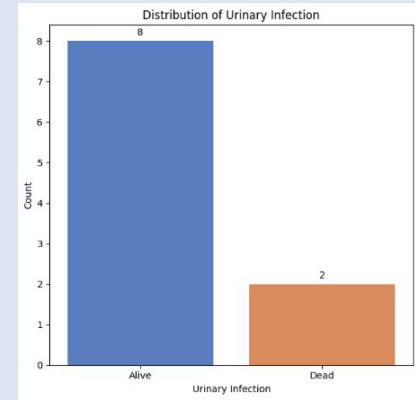

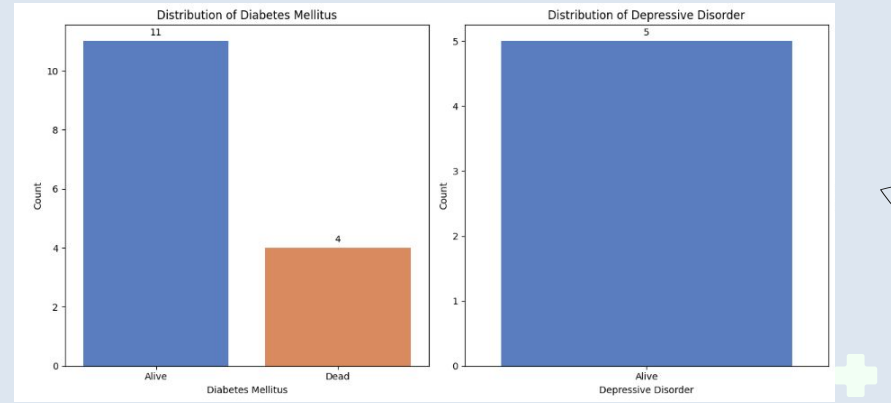

Normal Range of BUN:
7 to 20 mg/dL

g

Normal Range of Heart Rate:
60 to 100 bpm

There are no significant correlations

50% of the patients that died received at least one of the diagnosis predictors

RESULTS

T-test for age: $t_{\text{stat}}=0.06923367171705226$, $p_{\text{value}}=0.9451173153124106$
T-test for mean_Creatinine: $t_{\text{stat}}=0.44074161983850324$, $p_{\text{value}}=0.6615580210764506$
Mann-Whitney U Test for mean_BUN: $U_{\text{stat}}=141.0$, $p_{\text{value}}=0.11786100553396059$
T-test for mean_Heart Rate: $t_{\text{stat}}=0.1354189287835617$, $p_{\text{value}}=0.8928982926625598$
Chi-Square Test for gender: $\chi^2=0.13736001223101335$, $p_{\text{value}}=0.7109197515495319$
Chi-Square Test for diabetes_mellitus: $\chi^2=0.0$, $p_{\text{value}}=1.0$
Chi-Square Test for depressive_disorder: $\chi^2=0.7529172644667624$, $p_{\text{value}}=0.3855541764532162$
Chi-Square Test for urinary_infection: $\chi^2=0.007829520697167748$, $p_{\text{value}}=0.9294915405421293$

- Non-White groups = more risk to die during ICU stay
- Higher risk of dying for females
- Majority of patients (90%) show abnormal lab results
- Lab results supports relevant diagnosis
- No influence on death regarding insurance type
- No significant influence of predictors on their own on death

RECOMMENDATIONS

- Increase the sample dataset
- Collect socio-economical and habits data on patients
- Need of predictors combination to check influence on death - functions and ML
